EX. 8: Workflow Using Zoho Creator

1. AIM

To study and configure workflows in Zoho Creator to automate actions based on specified events and conditions within an application.

2. INTRODUCTION

A workflow in Zoho Creator automates tasks when a particular event occurs. It reduces manual effort by performing predefined actions based on configured conditions. Depending on the workflow type, triggers may include record creation, record editing, or a scheduled event. Actions can include notifications, field updates, and Deluge scripts.

3. OBJECTIVES

• To understand the purpose of workflows in Zoho Creator.

• To learn how to configure workflow triggers.

• To define conditions for executing actions.

• To automate repetitive tasks in an application.

• To understand how workflows improve efficiency.

4. PROCEDURE

1. Log in to Zoho Creator and open the required application.

2. Navigate to the Workflow section and create a new workflow.

3. Enter a suitable workflow name and description.

4. Select the form or application component associated with the workflow.

5. Choose a trigger event, such as record creation or record editing.

6. Specify the conditions under which the workflow should run.

7. Select an action, such as sending a notification, updating a field, or executing a Deluge script.

8. Configure the action according to the application requirements.

9. Save the workflow and test it using sample records.

10. Verify that the action runs when the selected event and conditions are met.

5. TYPES OF WORKFLOW TRIGGERS

Trigger	Description
Record Created	Runs when a new record is added.
Record Edited	Runs when an existing record is modified.
Record Deleted	Can run when a record is deleted, where supported.
Schedule	Runs at a configured time or interval.
Field Action	Runs based on a configured field event.

6. WORKFLOW ACTIONS

• **Email Notification:** Sends an email when a configured event occurs.

• **Field Update:** Automatically changes a field value.

• **Deluge Script:** Runs custom logic for the required task.

• **Record Operations:** Performs supported actions on application records.

• **Notifications:** Alerts users about important events.

7. APPLICATION

In a Student Study Planner application, a workflow could remind a student about an upcoming task deadline or update a task status when a configured condition is met. Such automation helps reduce manual checking and supports better organization of study activities.

8. OUTPUT

The workflow setup involves selecting a trigger, defining any required conditions, and specifying the action to perform. Suitable evidence may include the workflow creation page, trigger and condition settings, action configuration, and a saved or tested workflow.

9. RESULT

Thus, the workflow concept and its configuration in Zoho Creator were studied. Workflows can automate repetitive application tasks by running predefined actions when specified events or conditions occur.
