

EX. 6: Implementation of 10 Deluge Functions in Zoho Creator

Name: Subhalakshmi M

Register No.: 240701539

AIM

To implement and demonstrate ten basic Deluge functions in Zoho Creator for performing numerical calculations, conditional operations, loops and simple data-processing tasks.

PROCEDURE

1. Open Zoho Creator and access the Deluge scripting environment.
2. Create a new application or use the existing application for testing the scripts.
3. Open the Workflows / Functions section and select the option to write a Deluge script.
4. Write simple Deluge statements using variables, conditions and loops.
5. Implement different numerical and logical operations using separate scripts.
6. Execute each script with suitable sample values.
7. Observe the result displayed after successful execution.
8. Verify the outputs and save the implemented functions.

OUTPUT

1. Sum of Two Numbers

```
1  a = 10;  
2  b = 20;  
3  sum = a + b;  
4  info "Sum = " + sum;
```

Function Executed Successfully

INFO

Sum = 30

The Deluge script accepts two numerical values, calculates their sum and displays the result.

2. Check Whether a Number is Even or Odd

```
1  num = 15;
2
3  if(num % 2 == 0)
4  {
5      info "The number is Even";
6  }
7  else
8  {
9      info "The number is Odd";
10 }
```

Function Executed Successfully

INFO
The number is Odd

The script checks whether the given number is divisible by 2 and displays whether the number is even or odd.

3. Find the Largest Number

Deluge
by Zoho Creator

Learn Deluge Try Now

```
1  a = 25;
2  b = 40;
3  c = 15;
4
5  if(a >= b && a >= c)
6  {
7      info "Largest = " + a;
8  }
9  else if(b >= a && b >= c)
10 {
11     info "Largest = " + b;
12 }
13 else
14 {
15     info "Largest = " + c;
16 }
```

Function Executed Successfully

INFO
Largest = 40

The program compares the given values using conditional statements and displays the largest number.

4. Check Positive, Negative or Zero

```
1 num = -10;
2
3 if(num > 0)
4 {
5     info "The number is Positive";
6 }
7 else if(num < 0)
8 {
9     info "The number is Negative";
10 }
11 else
12 {
13     info "The number is Zero";
14 }
```

Function Executed Successfully

INFO

The number is Negative

The script checks the value of a number and identifies whether it is positive, negative or zero.

5. Calculate Factorial

```
1 num = 5;
2 factorial = 1;
3
4 numbers = {1, 2, 3, 4, 5};
5
6 for each i in numbers
7 {
8     factorial = factorial * i;
9 }
10 info "Factorial = " + factorial;
11
```

Function Executed Successfully

INFO

Factorial = 120

The program uses a loop to calculate the factorial of the given number and displays the calculated value.

6. Multiplication Table

The script uses iteration to generate and display the multiplication table for the given number.

7. Check Prime Number

The program checks whether the given number has factors other than 1 and itself and displays whether it is prime.

8. Reverse a Number

The script reverses the digits of the given number and displays the reversed value.

9. Check Palindrome

The program reverses the given value and compares it with the original value to determine whether it is a palindrome.

10. Grade Calculation

The screenshot shows the Deluge script editor interface. On the left, there is a sidebar with categories: BASIC, CONDITION, and COLLECTION. The BASIC category is selected, showing options like 'set variable', 'add comment', and 'info'. The main editor area contains a script with the following code:

```
1 marks = 85;
2
3 if(marks >= 90)
4 {
5     info "Grade = A+";
6 }
7 else if(marks >= 80)
8 {
9     info "Grade = A";
10 }
11 else if(marks >= 70)
12 {
13     info "Grade = A";
14 }
15 else if(marks >= 60)
16 {
17     info "Grade = C";
18 }
19 else if(marks >= 50)
20 {
21     info "Grade = D";
22 }
23 else
24 {
25     info "Grade = F";
26 }
```

A notification box titled 'Function Executed Successfully' is displayed over the script, showing an 'INFO' icon and the text 'Grade = A'.

The script uses conditional statements to determine the grade based on the marks entered.

RESULT

Thus, ten Deluge functions were successfully implemented and executed in Zoho Creator. The functions demonstrated basic numerical calculations, conditional statements, loops and simple validation operations using Deluge scripting.
